

Many Glacial and Interglacial Epochs occur over the 2.5 million years B.C.E. to 300,000 B.C.E.. Sea levels rise and fall 300ft on average. Average Global temperatures rise and fall 8 to 10 degrees Celsius. The ebb and flow of the glacial cycles, seems to repeat in 100,000 to 120,000 year intervals.

From 2.5M B.C.E. to 300,000 B.C.E. Hominid Species had organized the 1st Industrial Complexes making stone tools in quantities. By 1.6M B.C.E. hand axes and stone points that were flaked on two sides, hominids are demonstrating skill and technique. Undisputed evidence of a footprint that dates to 1.5M B.C.E. of a, "most likely", Homo Erectus walking upright. Homo Erectus fossils have been dated from 1.8M B.C.E. to the 210,000 B.C.E. (12 discoveries are outside of Africa). Bone Tools are found at the same Epoch. From 1.5M B.C.E. to 790,000 B.C.E. evidence of hearths and cooking. The 1st living species that took control of fire. 500,000 B.C.E. Hominid Species are hunting large animals with spears. Four wooden spears dated circa 400,000 B.C.E. have been found in Germany in 1995. Use of pigments for body adornment and painting developed next around 400,000 B.C.E. to 350,000 B.C.E.. Homo Neanderthalensis exists as a distinct species from 600,000 B.C.E. to around 30,000 B.C.E. and no fossils exist that are younger than this time. 570,000 years tops Homo Sapiens by 370,000 years of existence as a distinct species. Over the course of the Pleistocene 2.58M B.C.E. to 9700 B.C.E., to the start of The Holocene 9700 B.C.E. to the present, there have been 14 glacial periods with the start of the Holocene signifying the end of the Quaternary Pleistocene Epoch. From all hominid species, Homo Sapiens are the only homogeneous species to survive and thrive to the present. And we are novel on the timeline scale. And in that modest amount of time, we have accomplished more in a short time, than any other species that has ever existed. The Human Genome Project evidence says that we are the descendants of a potential 2000 to 3000 survivors (high thousands maximum) of the last great extinction challenge. As *Winston Churchill might say, "Some Bottle. Some Neck"*.

Glacial	THE GAP IN THE TIMELINE: After the Lake Toba Eruption, evidence of Homo Sapien life is scant. The obvious assessment of educated reasoning would deduce that there were few of our ancestors around to procreate and create evidence for archeology to find today. Simple conclusion and the lack of evidence for the next 20,000 years, validates the catastrophic challenge for all life. The smartest and fittest survived.
